Report 2: Tasks

Due Date: Apr. 10th, 11:59pm

Description

In this report, your group will work on tasks with your datasets and attempt multiple methods/models to solve those tasks. The design of those tasks is left to your group to decide, but it must be designed properly, following the discussions we had in class. It's better to investigate multiple tasks, such as classification/regression, anomally detection, customer behavior analysis, product recommendation, etc.

Explain in detail, how you designed your tasks/datasets. I should be able to follow your description and create the same setup (e.g., how you selected the training set or trained your models). There are many other things to consider and you should mention all of them. If I don't understand what you did, you may lose points.

The methods that you apply to the tasks should be reasonable, but I am not expecting amazing results. Try to explore multiple approaches and compare their peformances. Try to utilize various statistical analysis metrics to analyze your results.

If you have tasks that focus on the operations with Big Data tools like Hadoop and Spark, describe them properly.

This report **must** be written using provided latex style file and bibliography file. Only one member of the group is required to submit the report.

Similar to Report 1, you must submit your code with a subset of your data (~500 samples) so that I can run your code at the command line "python report_2_task.py <location_of_data_file>". This code should create the similar setup for your task, run your models, and calculate the performance, which it prints to the screen. Again, these values will not be the same as your report because I am using a subset of your dataset.

What to Submit

1. A pdf file that was created using the provided latex style file that includes your task description, methodologies, results analysis, etc.
2. Code that you used to run your models, and a Readme File explains how to run.
3. You may submit screenshots of your project as well, such as coding environment, results, etc.

Rubric Guide

This is a rough guide to how the report will marked, but it might differ a little.

Points	Category
2	Latex format
2	Grammar
6	Tasks description/design
20	Methodologies and Results Analysis
5	Code
